GCSS TOOL CATALOG

- Kodak Field Engineers should order tools listed in this catalog through *Scan Plus*.
- When ordering tools with an identifier of the form "TL-XXXX", the Part No. should be specified as "XXXXTL".
- Many of the tools in this catalog are stocked by an outside vendor. Even though the quantity in stock shown in the SPIRIT system is "0", the tool is still in stock at the vendor.

PLEASE NOTE: The information contained herein is based on the experience and knowledge relating to the subject matter gained by Eastman Kodak Company prior to publication.

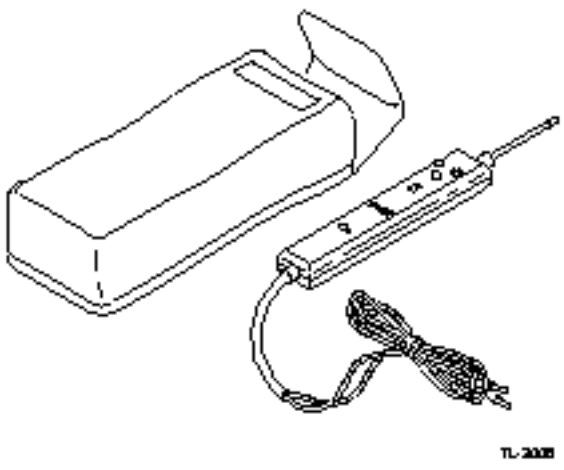
ELECTRICAL - LOGIC PROBES

TL-3008--LOGIC PEN



Two SWITCHES are provided, enabling the operator to select either of two factory programmed thresholds for use in servicing TTL and C/MOS. The last switch selects stretch or memory.

Operating Power Vcc	TTL	C/MOS
	4.75 to 5.5V DC	5.0 to 15.0 V DC
Standby Current	35 MA	35 MA @ 5.0 V 100 MA @ 24.0V
Max. Operating Current	50 MA	50 MA @ 5.0 OV 110 MA @ 24.0 V

Loading Factor: load presented circuit under test at logic "1" or "0" >2 megohms (all modes).

Nominal Logic Voltage Response:

Operating Power Vcc	TTL	C/MOS
Logic "0" Lamp Off	0 to 0.8V	0 to 30% VDD
Logic "1" Lamp On	2.4 to Vcc	70% VDD to VDD

Overvoltage Protection at Probe Tip: 140 V DC continuous

Power Lead Reversal Protection: Maximum Reverse Voltage - 100 V

Power Lead Overvoltage: Overvoltage shut down protection operates at 27.0 V ± 1 V. Protected to 50.0 V.

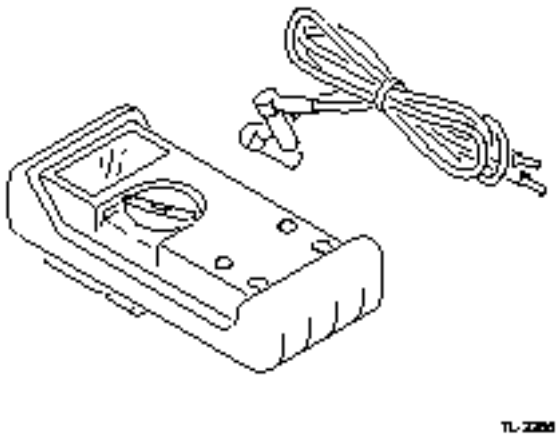
FLUKE 76 TRUE RMS



The FLUKE METER includes the following specifications.

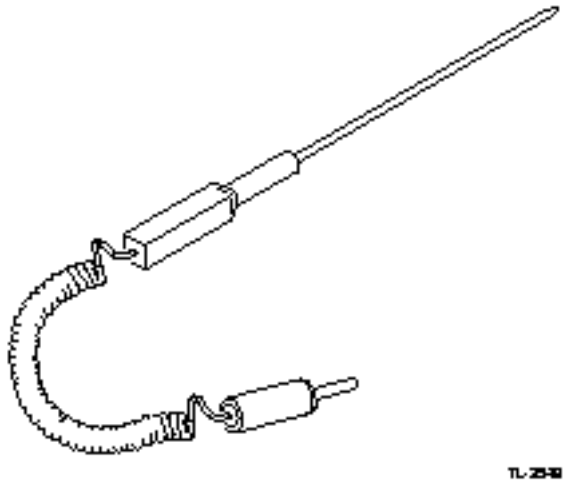
Maximum Rated Voltage between any terminal and earth ground is 600V DC, 600 V AC rms (sine)

Fuse Protection:	40 mA 1A 600 V FAST Fuse 10A 15A 600 V FAST Fuse
Display:	Digital: 4000 counts, updates 4/sec.Analog: 63 seconds, updates 40/secFrequency: 9,999 countsCapacitance: 9,999 counts
Response Time of Digital Display:	V AC < 1.5s (for upscale only)V DC < 1s < 1s to 40 kW, <2 s to 4 MW, < 10s to 40 MW,
Operating Temperature:	0 to 55× C
Storage Temperature:	-40 to 60× C
Temperature Coefficient:	0.1 x (specified accuracy)/ × C(< 18 or > 28× C)
Relative Humidity:	90% (0 to 30 × C)75% (30 to 40 × C045% (40 to 50× C)35% (50 to 55× C)
Altitude:	Operating: 2,000 metersStorage: 12,000 meters
Battery Type:	9 Volt, NEDA 1604A or IEC 6LR61
Battery Life:	500 hours typical with alkaline
Continuity Beeper:	4096Hz
Vibration:	Per MIL-T-28800E, Class IIISinusoidal, Nonoperating
Drop:	NAI/IA-A81.0- 1994 and EN61010-1, 19931 meter drop to hardwood on concrete
Enclosure:	Conforms to IP-40 Per IEC-529
Size (HxWxL)	2.8 x 7.5 x 16.6 cm(1.12 x 2.95 x 6.55 in.)
EMC:	EN 50081-1, EN 50082-1
Surge Protection:	6 KV peak per IEC 1010-1, 1990-09 and ANSI/IEEEC62.41-1991
Safety:	600 V AC, 600 V DC maximum voltage between any terminal and earth ground.Complies with IEC-1010-1, 1990-09 and ANSI/ISA-S82.01-94 for use with overvoltage category III locations, <600 V, UL3111, CSA/CAN C22.2No. 1010.1-92 and EN61010 part 1-1993.
Certifications:	CE CSAUL and TUV pending

Copyright © 2000, Eastman Kodak Company

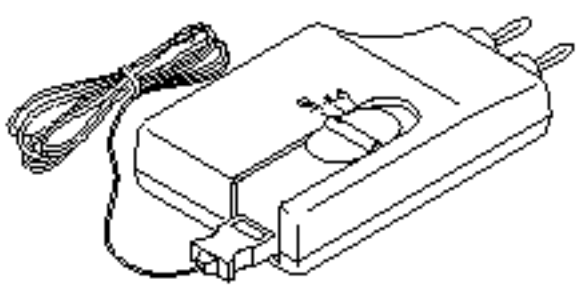
TL-3459--PROBE - REPLACEMENT

REPLACEMENT PROBE for TL-3792.



Copyright © 2000, Eastman Kodak Company

TL-3584--MODULE - THERMOCUP



TL-3584

The THERMOCUP MODULE is a low cost temperature measurement accessory designed to work with any digital multimeter. It converts the microvolt output from a Type K thermocouple into a 1 millivolt per degree signal.

The on-off switch allows selection of degrees "C" or "F" output scaling. Input is via a mini thermocouple connector, with provision inside for hardwiring. Immersion probes and surface probes are also available.

The output of the 80TK may be read on any DMM having 10 M ohm or greater input impedance and a mV dc scale. It is powered by a standard 9V battery, with a typical operating life of 1600 hours. Battery condition can be checked on the DMM with battery test instructions printed on the 80TK.

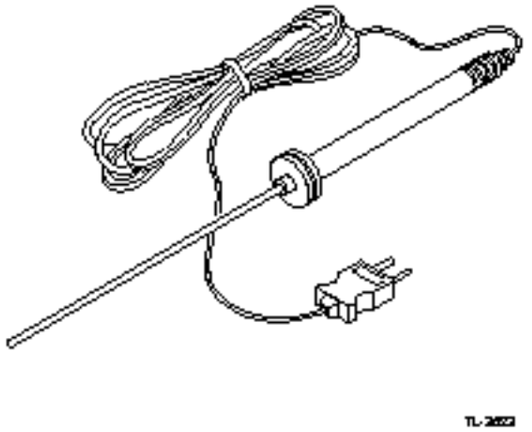
Measurement range: -50 to 1000ºC (-58 to 1832ºF).

Ambient Operating range: 0ºC to 50ºC, 32 to 122ºF.

-50 to -20× C 2.5% ±2× C	350 to 500× C 1.75% ±2× C
-58 to -5.8× F 2.5% ±3.6× F	663 to 932× F 1.75% ±3.6× F
-20 to 350× C 0.5% ± 2× C	500 to 1000× C 2.0% ± 2× C
-4 to 662× F 0.5% ± 3.6× F	993 to 1832× F 2.0% ± 3.6× F

Copyright © 2000, Eastman Kodak Company

TL-3623--PROBE - IMMERSION



Used with THERMOCUP MODULE TL-3584. For liquids and gels. Protected from tip to handle by an Inconel sheath; suitable for most general purpose measurements.

Measurement Range: -196 to +1090ºC (-320 to +1922ºF)

Accuracy: (with respect to NIST tables)

Range	Max Error
-196 to -110× C (320 to -166× F)	± 4% of Rdg
-110 to -408× C (-166 to -40× F)	± 4.4× C (7.92× F)
-40 to 275× C (-40 to -527× F)	± 2.2× C (3.96× F)
275 to -1090× C (527 to -1922× F)	± 0.75%

Copyright © 2000, Eastman Kodak Company

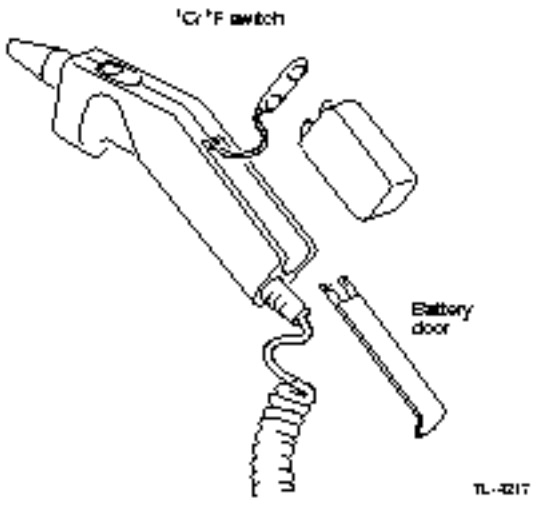
TL-4217--PROBE - INFRARED TEMPERATURE



The TEMPERATURE PROBE is a low cost, non-contact temperature measurement accessory designed to work with any digital multimeter. It converts infrared light emitted by an object into a 1 mV dc per ºC or ºF signal.

The infrared probe has a selection switch for direct reading of temperature in ºC or ºF on the digital multimeter display.

The output of the infrared probe may be read on any DMM having a 10 M or greater input impedance, a 3-digit display, and accepting standard diameter shrouded banana plugs. It is powered by a standard 9V battery, with typical battery life of 50 hours. The probe features an automatic shut-off after 10 minutes of operation to save battery life.

Temperature Range:	-18× C to 260× C or 0× F to 500 × F
Accuracy:	±3% (+3 digits) of reading. Repeatability: ±1% of reading
Emissivity:	Fixed at.95. Response Time: 1 second
Optical Resolution:	4 to 1 distance to spot size
Output:	1 mV per × C or × F (switchable)
Power:	9V alkaline battery
Battery Life:	50 hours (automatic shut-off after 10 minutes).
Ambient Operating Temperature:	0 to 65× C (32 to 150× F)

CURSORS

Accuracy: Time: ±2%, ±3% magnified of reading plus 0.1 Div.

Absolute Volts: 10 to ±30 ºC is ± (1% of reading + 2% of one vertical division + HF display errors + 0.5 mV + trace shift errors): +30 to +55ºC is ± (1% of reading +2% of one vertical division + HF display errors + 4 mV + trace shift errors).

POWER REQUIREMENTS

Line Voltage Ranges - 115 V; 90-132 Vac RMS, 230 V: 180-250 Vac RMS

Line Frequency - 48 to 440 Hz

Maximum Power Consumption - 85 W.

MECHANICAL CHARACTERISTICS: Cooling Method - Forced-air circulation with no air filter.

ENVIRONMENTAL AND SAFETY

The TAS Series scopes are designed to set specific environmental conditions, as described in MIL-T-28800E for Type III, Class 3, Style D equipment as specified below. Other environmental characteristics are available.

Temperature: -1 to +55× C (operating); -5 to +71× C (nonoperating).

Humidity: Operating and nonoperating, up to 95% RH at or below +40× C up to 75% RH from 41 to 55× C.

Altitude: 15,000 ft/4572 m (operating); 40,000 ft/12192 m (non operating).

Randon Vibration: 0.31 g's RMS (operating); 2.46 g's RMS (nonoperating), from 5 to 500 Hz, 10 minutes each axis.

Electrostatic Discharge Susceptibility: Up to 8 kV with no change to control settings or impairment of normal operation; up to 15 kV with no damage that prevents recovery of normal operation by the user.

Safety: UL 1244 Listed, Certified to CAN/CSA 22.2 No. 231- M89.

Emissions: VFG 243, Category B; FCC Code, Part 15, Subpart B, Class A.

X-Y Operation Sensitivity Ranges: Same as Vertical Deflection System.

X-Y Accuracy: ±4%.

X-Axis Bandwidth: DC to 3 MHz.

Phase Difference Between X and Y: ±3× DC to 150 kHz.

CRT SYSTEM - Display - 8 cm x 10 cm, 14 kV nominal voltage.

Z-Axis Input: Positive voltage decreases intensity; ±2 V blanks maximum intensity trace usable to 20 MHz.

Controls: Sweep Intensity, Focus, Readout Intensity, Scale Illumination, Trace Rotation.

Probe Compensator Output - Output Voltage: 0-5 V ±10% into 1 M W load.

Frequency: 1 kHz ±5%

Typical Rise Time: 500 ns.

Typical Aberrations: ±1% after the first 10 following the square wave transition.

Nonvolatile Setup Memory - Number of Nonvolatile Setup Memories - 4.

Rentention Time: Typically 10 years.

CHARACTERISTICS

Except as noted, the following specifications are common to the TAS 400 Series.

Bandwidth: 100 MHz

Rise Time: 3.5 ns

Vertical System - Deflection Factor: 2 mV/div to 5 V/div, continuously variable between V/div settings.

Deflection Factor DC Accuracy - ±2.5%

Bandwidth Limit - 20 MHz, independent channel control.

AC, DC, GND.

Max Input Voltage: ±400 V (DC + peak AC); derate at 20 dB/decade from 100 KHz to 13 V at 3 MHz.

Input R and C: 1 M ±1% in parallel with 20 pF ± 2.0 pF.

Channel Isolation: 50 dB at 10 MHz, 35 dB at 100 MHz.

Vertical Control (2CH, 465): CH1; CH2; ADD CH1 + CH2; INVERT either CH1 and/or CH2; ALTernate or CHOP between CH1 and CH2 for multiple channel displays.

Vertical Control (4 CH, 475/485): CH1; CH2; CH3; CH4; ADD CH2 + CH2; ADD CH3 + CH4; INVERT any/all channels; Alternate or CHOP between all channels.

AC-COUPLED Lower - 3dB Point: 10 Hz with a 1X probe. The AC-coupled lower frequency limits are reduced by a factor of 10 when 10X passive probes are used.

Common Mode Rejection Ratio: 10:1 at 50 MHz.

HORIZONTAL SYSTEM - Main Sweep Time Base Range: 0.5 s/div to 20 ns/div (to 2 ns/div with X10 magnification).

Delayed Sweep Time Base Range: 5 mx/div to 20 ns/div (to 2 ns/div with X10 magnification).

Time Base Accuracy: ±2%, ±3% magnified.

Delay Jitter: 25,000 to 1 for sweep speeds slower than 1 ms/div. 10,000 to 1 for all other sweep speeds.

TRIGGERING - Main Mode Selections: AUTO LEVEL (with auto baseline), AUTO, NORMAL, TV LINE, TV FIELD (odd, even, or both) SGL, SEQ.

Delayed Mode Selections: RUNS AFTER DELAY, TRIGGERABLE AFTER DELAY, and TV LINE (from MAIN source).

Trigger Coupling: DC, Noise Reject, HF Reject, LF Reject, and AC for both main and delayed.

Lowest Frequency for Successful Operation of "Set Level to 50%" Function: 50 Hz with 1 division internal, 100 mV EXT or 1 V EXT/10 Source.

Trigger Source (465): CH1, CH2, EXT, LINE, ADD, EXT/10

Trigger Source (475/485): CH1, CH2, CH3, CH4, LINE, ADD CH1 + CH2, ADD CH3 + CH4.

Holdoff Control Range: Increases Main sweep holdoff time by a factor of at least 10.

External Trigger Inout (465): 1 M ±2% in parallel with 20 pF ± 2.0 pF.

Maximum Input Voltage: ±400 V (DC + peak AC); derate at 20 dB/decade from 100 KHz to 13 V at 3 MHz.

Trigger Sensitivity - DC: 0.3 division from DC to 25 MHz, increasing linearly to 1 div. at 150 MHz.

Noise Reject: 1.2 division from DC to 25 MHz, increasing linearly to 2.2 div, at 150 MHz.

HF REJ: 0.3 division from DC to 10 kHz; attenuates signals above the upper -3 dB cutoff frequency of 50 kHz.

LF REJ: 0.3 division from 100 kHz to 25 MHz, increasing linearly to 1 div.

AC: 0.3 division from 350 Hz to 25 MHz, increasing linearly to 1 div. at 150 MHz.

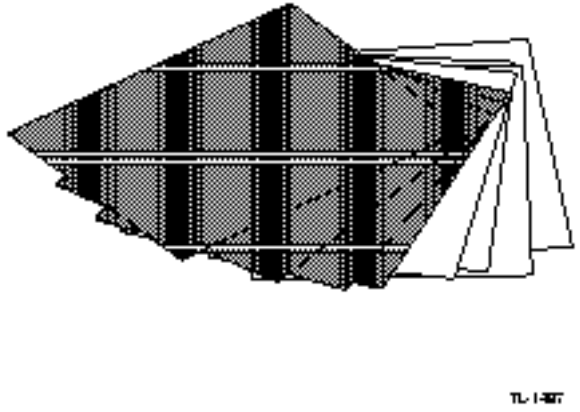
TL-1497--TEST SET - COLORED DOCUMENT



This is for use on microfilming machines that have an exposure control. The lamp brightness should be adjusted for the full range of colored documents that the customer will photograph. The testing of microfilming machines in a shop also requires a set of colored documents which compiles with manufacturing quality control standards.

Consists of one sheet each of 215.9 x 279.4 mm ($8^1/_2$ x 11 in.) bond paper in each of the following colors:

1. White
2. Russet
3. Canary
4. Goldenrod
5. Blue, light
6. Green
7. Salmon
8. Pink
9. Cherry
10. Blue, deep

- TL-8415, 8-32 TAP
- TL-8418, 10-32 TAP
- TL-8421, 1/4-20 TAP

TAPS

Service Parts Management stocks the TAPS listed by the tool number on the preceding chart. The correct name for each TAP is: first the TAP SIZE, then the word TAP. Example: 4-40 TAP. The limits for each TAP is from 0-80 to 1-72, H-1; 2-56 to 6-40, H-2; 8-30 and above, H-3.

All TAPS are PLUG STYLE, SPIRAL-POINTED GROUND-THREAD HAND TAPS, HIGH-SPEED STEEL. Bay State list No. 926 for MACHINE SCREW sizes and 908 for fractional inch sizes.

The SPIRAL-POINTED GROUND-THREAD HAND TAP is approved for use in all materials. This style TAP drives the chips ahead of the point during the tapping operation.

When tapping through a hole:

1. Wet the TAP and work with SULFURIZED LARD OIL TL-1520.
2. Start the TAP straight.
3. Drive the TAP until it extends through the work. Apply additional OIL during the tapping operation. Do not force the TAP if it begins to bind. *Carefully* back the tap from the hole, clear all chips, and begin again.
4. Remove the TAP.

When tapping blind holes:

1. Check the depth of the hole. The hole should be 3 TAP diameters deeper than the required thread.
2. Wet the TAP and work with SULFURIZED LARD OIL TL-1520.
3. Start the TAP straight.
4. Carefully drive the TAP. If the TAP binds, carefully back it out, clear chip, and begin again. Continue to add OIL during the tapping operation. Drive the TAP to the desired depth, but no deeper, as the TAP may jam and break.
5. Remove the TAP.

COMMON TAPPING PROBLEMS, THEIR PROBABLE CAUSE AND CORRECTION

1. TAP overloading cause by pickup.
    - Loading or pickup on TAP surfaces causes most TAP breakage. As soon as this is observed, it should be corrected. To let it go, means that the pickup will finally be so great that the TAP will weld in the hole and the power of the machine will break the TAP. Check lubrication. Other causes of loading are: LANDS are to wide, CHIPS packing in the FLUTES, or a dull TAP.
2. Roughness in THREADS.
    - If all other factors and variables have been carefully checked, try a negative grind on the HEEL of the TAP. This overcomes THREAD tearing by the TAP when backing out. Insufficient HOOK ANGLE 4 can also cause roughness in the THREADS.
3. Broken TEETH.
    - The TAP may be too hard (over Rockwell C-63) for the type of material being cut. Grind broken TEETH entirely away and the TAP will be serviceable.
4. Loading on stringy soft metals.
    - This can usually be overcome by polishing the TAP after grinding. The better the TAP is polished, the less tendency for loading.
5. TAP slows up -- more power required.
    - This is generally an indication of an improperly ground or dull TAP. Check the HOLE diameter. DRILL BITS may have worn enough to be cutting undersized. Check to see if the axis of the HOLE and the TAP are parallel. Check for chips packed in the FLUTE. This can develop if the FLUTES are shallow or the LANDS are too wide. Chips can be controlled perfectly, and are, in well-designed and correctly ground TAPS. The power required to break the CHIP packing is often more than that required to TAP. On a deep hole this will break the TAP.
6. TAP cuts when backing out.
    - This is usually caused when the TAP cuts an oversized HOLE, leaving no support for the TAP when backing out and thereby permitting it to cut.

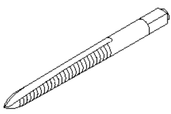
MECHANICAL - HELICOIL TOOLS

TL-1327 to TL-1344--HELICOILS

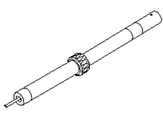
HELICOIL INSERTS are used to repair broken screw threads in metal or plastic. HELICOIL INSERTS are similar to HELICAL SPRINGS in general appearance. The INSERTS are made of stainless steel wire with a diamond-shaped cross section. The TANG is needed for installation of the INSERT and is broken off and removed after installation.

Use only HELICOIL TAPS to make threads for the HELICOIL INSERTS. Use the table to select the correct tap and drill.



Use the HELICOIL INSERTING TOOL to prewind and install the inserts. The INSERTS are larger in diameter than the tapped holes into which they are installed. The INSERTING TOOL is used to prewind an INSERT to the diameter of the tapped hole and then to install it. The prewinding provides spring tension of the installed INSERT against the tapped hole, preventing it from unscrewing. A separate INSERTING TOOL is required for each INSERT.

Use the HELICOIL AUTOMATIC TANG BREAK-OFF TOOL to remove the tang from the INSERT after installation. Tang removal is necessary in order for a screw to pass completely through the insert. A separate TANG BREAK-OFF TOOL is required for each size insert.



Use the HELICOIL EXTRACTING TOOL to remove inserts. The TAPERED BLADE is inserted into the INSERT and then struck with a HAMMER to nick the inside of the INSERT. The insert can then be removed. There are 2 size EXTRACTING TOOLS.

SELECT THE HELICOIL INSERT

The INSERT size is the thread size of the screw to be used. The INSERT length is the length of the part of the screw which is inserted into the hole. When the INSERT is installed, the outer end should be below the surface of the part into which it is installed.

INSTALLING HELICOIL INSERTS

- See the table for drill bit size and make hole.
- Tap the hole to its full depth.
- Remove all chips from the tapped hole.
- Load the INSERT into the HELICOIL INSERTING TOOL as follows:
  - Pull the MANDREL back and load the INSERT into the chamber, with the TANG end away from the MANDREL.
  - Slide the MANDREL into the INSERT, so that the slot in the MANDREL engages the TANG.
  - Push the MANDREL all the way into the HOLDER, and rotate the MANDREL to wind the INSERT into the threaded area of the HOLDER. Wind only enough so that the end of the INSERT is even with the end of the HOLDER. DO NOT INSTALL. If the INSERT is wound so that it emerges from the end of the HOLDER, wind the INSERT out of the rest of the way and start again.
  - Hold the INSERTING TOOL squarely over the tapped hole and wind the INSERT into the hole until the outer end of the INSERT is just below surface. If the tapped hole is countersunk or counterbored, install the INSERT so that the outer end is just below the surface at which the threads begin. To determine when the INSERT is fully installed, occasionally pull back gently on the INSERTING TOOL.
- Break the TANG from the INSERT as follows:
  - Place the punch end of the AUTOMATIC TANG BREAK-OFF TOOL into the INSERT so that it bears against the TANG.
  - Hold the TOOL firmly and squarely and push straight down on the BARREL until the TOOL clicks. The impact breaks off the TANG.
  - Remove the TOOL straight out from the hole. The TOOL is automatically reset for the next use.
  - Remove the TANG from the hole.

REMOVING the HELICOIL INSERTS

To remove an INSERT:

- Insert the blade end of the correct HELICOIL EXTRACTING TOOL into the INSERT, so that the blade edge bears against the INSERT about 90 degrees from the upper end of the INSERT. If the blade edge bears against the INSERT near its end, the end of the INSERT is liable to gouge into the metal when the tool is rotated.
- Strike the top of the EXTRACTING TOOL lightly with a HAMMER.
- Bear down on the EXTRACTING TOOL and rotate it counterclockwise to unscrew the INSERT.

If the INSERT is too deep to be removed according to the above procedure without damaging the threads, countersink, or counterbore the metal into which it is inserted, modify the EXTRACTING TOOL accordingly by grinding. Do not damage the blade of the unmodified part of the EXTRACTING TOOL.

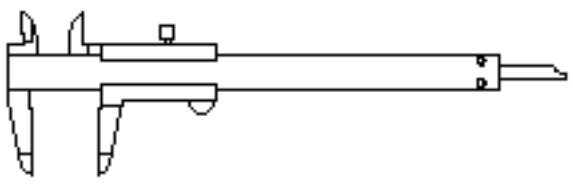
MECHANICAL - MEASURING DEVICES

TL-1727--CALIPER - 6 INCH VERNIER



TL-1727

A VERNIER CALIPER consists of two precision steel rules which permit direct measurements to 0.001 inch. One rule on the bar of the VERNIER CALIPER is graduated in increments of 0.025 inch with each 0.100 inch numbered 1 to 9 and each 1.000 inch numbered with a larger numeral. The VERNIER plate has 25 divisions (some VERNIER CALIPERS have 50) spaced so that the 25 divisions occupy the same space as 49 divisions on the bar.

The difference between the width of one of the 25 spaces on the VERNIER and two spaces on the bar is 0.001 inch. When the 0 line on the VERNIER is set on the 0 line on the bar, the first line on the VERNIER will differ from the second line on the bar by 0.001 in, the second by 0.002 inch and so on. The difference will continue to increase by 0.001 inch for each division until graduation 25 coincides with the 49th on the bar.

NOTE: If for any reason you suspect the tool to be inaccurate or if it is or has been dropped, it should be removed from use and checked by an instrument shop.

PRIOR TO USE

Wipe the bar and jaws to remove any grit, etc.

Following these procedures will provide a usable tool for many years.

DESCRIPTION

This VERNIER CALIPER has a capacity of 152 x 0.025 or 0.03 mm or 6 x 0.001 inches. Use to measure depth, outside, and inside measurements (*MITUTOYO* Number 530-312).

Step 1. Observe the position of the 0 line on the VERNIER plate. It is to the right of 1 and between 1 and 2; therefore, it is 1.000/1.000 inch plus.

Step 2. Observe the position of the 0 line on the VERNIER plate. It is between the small 3 and 4 bar; therefore, it is 0.300/0.300 inch plus.

Step 3. Observe that the position of the 0 line is between 2nd and 3rd small graduations between 3 and 4. Each small graduation = 0.025 inch, and is beyond the 2nd line; 2 x 0.025 = 0.050.

Step 4. Refer to the VERNIER plate and carefully look for one of the 25 lines which coincides with a line on the bar. Note which line it is (0 to 25). Each line represents 0.001 inch. In this case it is 16; therefore, 16 x 0.001 = 0.016.

Step 5. Add all numbers obtained in Steps 1 through 4.

- Step 1: 1.000
- Step 2: 0.300
- Step 3: 0.050
- **Step 4: 0.016**
- Total: 1.366

The dimension is 1.36 inches.

When the 0 line and 0.025 inch graduation line coincides on the bar, the dimension is derived the same as above except that in step 4 there are 0 1/1000 of an inch and the total dimension is the sum of steps 1, 2, and 3.

- Step 1: 1.000
- Step 2: 0.600
- Step 3: 0.075
- Total: 1.675

In order to obtain consistent and precision measurements, some practice is required to obtain the proper feel. When using the VERNIER CALIPERS, do not force the jaws down tight on the object being measured. The jaws should just contact the work and slip on and off with a very slight drag or resistance.

When measuring soft material, a different amount of force must be applied. One must not apply too much force as to compress the material.

When you measure the width of film, the film should be curved and measured across the curve. This makes the material stiffer.

Storage

The VERNIER CALIPER is a precision tool, therefore *care* is required.

Keep the CALIPER in its carrying case when not in use.

Keep the jaws about 0.032 to 0.050 inches apart. This will prevent moisture from being trapped and damaging the measuring surfaces.

Keep a light coat of SAE No. 20 Oil, TL-2199, on the tool.

When storing in the trunck or tool bag, keep it in such a way that it will not be subject to bending or excessive rough handling.

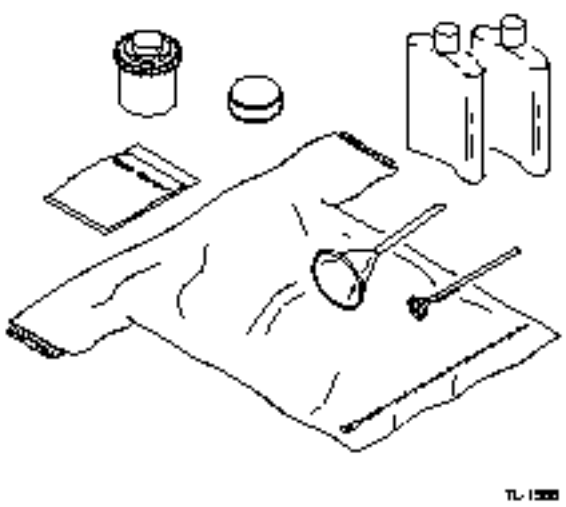
MECHANICAL - TOOL KITS/CASES/KITS

TL-1588--Kit - *Kodak* Service Developing



The Kodak Service Developing Kit TL-1588 will provide service personnel with an economical and convenient means of developing film tests on customer's premises. The appearance of a neat-looking DEVELOPING KIT, handled with the least possible mess, can only add to a customer's appreciation of the Kodak service system.

The complete DEVELOPING KIT TL-1588 consists of the following:

Quantity	Part Name	Part No.
1	CHANGING BAG	TL-1191
1	DEVELOPING TANK	TL-1325
1	THERMOMETER	TL-4802
2	SOLUTION FLASKS, 8 oz.	TL-1330
1	FUNNEL	TL-1584
1	35 mm ROLL FILM PROCESSING APRON	TL-1585
1	Kodak UNIVERSAL MQ DEVELOPER/FIXER	TL-1586

Replacements for the DEVELOPER and FIXER are to be ordered in the same manner as all service parts and supplies. The plastic solution flasks are reasonably impervious to photographic chemical action; however, it is not intended that they be used to store chemical solutions for an indefinite period. These particular chemicals will not keep for any length of time and they are to be made up only as needed. For the sake of convenience, the flasks may occasionally be used to carry ready-mixed chemicals to an installation. Be careful to identify the solutions properly by following the suggested color code for the solution flask caps (black for DEVELOPER - white for FIXER).
